

CensusGuard Dashboard

Full Build Documentation — For Kourtney / AI Constellation

Generated April 29, 2026 by Vega · INTERNAL USE ONLY

What This Document Is

This document contains everything needed to understand, maintain, migrate, or rebuild the CensusGuard dashboard — even without Vega's help. If credits are exhausted or Vega is unavailable, you have everything you need here.

Tech Stack

Layer	Technology	Notes
Frontend	React (JSX)	Standard React — no proprietary lock-in
Styling	Inline CSS	Dark theme, magenta/purple/cyan palette
Data (current)	Base44 SDK	Must be swapped on migration — see Section 5
Data (target)	Google Firestore	Already in your GCP project
Hosting (current)	Base44 platform	base44.app subdomain
Hosting (target)	Firebase Hosting	Free tier covers early stage
AI Model	Vertex AI AutoML v1.0	GCP: censusguard-proof-of-concept
EHR Integration	Kipu EHR (41 APIs)	Phase 2 — not yet live
Auth (current)	Base44 built-in	Must be replaced on migration
Auth (target)	Firebase Auth	Google sign-in, email/password

App Routes

Route	File	Access	Description
/	Home.jsx	Public	Marketing landing page
/demo	Demo.jsx	Public	18 fake patients — full dashboard experience, no login
/dashboard	Dashboard.jsx	Password	Real patient data (production)
/pitch	Pitch.jsx	Public	Investor pitch mini-site
/command	Command.jsx	Admin	Task + money tracker command center
/about	About.jsx	Public	About AnchorPoint
/contact	Contact.jsx	Public	Contact / demo request form
/admin	Admin.jsx	Admin	Admin panel

Entity Schemas (Database Tables)

These are all the data tables. Every record also auto-includes: id, created_date, updated_date, created_by.

Patient

Core patient record with risk scoring data

- name, episode_id, unit, room_number, smoker, level_of_care, admit_date

- risk_score (0-100), risk_tier (LOW/MODERATE/HIGH/CRITICAL)
- velocity (rate of change), alert_active, alert_reason
- top_drivers (array of risk factors), intervention, status
- + 20 demographic/clinical flags (substance, housing, employment, etc.)

ScoreHistory

Every rescore event — one record per score change

- patient_id, patient_name, score, previous_score, risk_tier
- day_in_treatment, timestamp, trigger (e.g. "BHT Check-in")
- drivers (array), velocity, alert_fired

ClinicalAction

Logged when clinician acts on an alert

- patient_id, patient_name, alert_reason, action_taken, action_type
- staff_name, timestamp, score_at_action, follow_up_required, outcome_note

GroupCohesion

Unit-level group energy tracking

- unit, cohesion_score, observation, observation_type
- staff_name, timestamp, affected_patients (array)

DemoLead

Demo request form submissions

- name, email, company, role, source

Task

Command center task tracker

- title, category, priority, status, due_date, notes, contact, linked_opportunity

MoneyTracker

Financial pipeline tracking

- label, category, amount, date, status, notes, recurs

SDK Migration: Base44 → Firestore

Every data call in the JSX files currently uses the Base44 SDK. On GCP migration, swap like this:

Base44 (current)

```
import { Patient } from '@api/entities';
const patients = await Patient.list();
const p = await Patient.get(id);
await Patient.create({ name: 'John', risk_score: 72 });
await Patient.update(id, { risk_score: 85 });
await Patient.delete(id);
const high = await Patient.filter({ risk_tier: 'HIGH' });
```

Firestore (target)

```
import { collection, getDocs, doc, getDoc,
  addDoc, updateDoc, deleteDoc, query, where } from 'firebase/firestore';
import { db } from '../firebase';

// LIST
const snap = await getDocs(collection(db, 'patients'));
```

```

const patients = snap.docs.map(d => ({ id: d.id, ...d.data() }));
// GET
const d = await getDoc(doc(db, 'patients', id));
// CREATE
await addDoc(collection(db, 'patients'), { name: 'John' });
// UPDATE
await updateDoc(doc(db, 'patients', id), { risk_score: 85 });
// DELETE
await deleteDoc(doc(db, 'patients', id));
// FILTER
const q = query(collection(db, 'patients'), where('risk_tier', '==', 'HIGH'));

```

Migration Checklist — Base44 → GCP

Phase 1: Setup (Week 1)

- Create Firebase project (or use GCP: censusguard-proof-of-concept)
- Enable Firestore in Firebase console
- Enable Firebase Hosting + Firebase Auth
- Sign Google Cloud HIPAA BAA — REQUIRED before any real patient data
- Install Firebase CLI: `npm install -g firebase-tools`

Phase 2: Code Migration (Week 2)

- `npm create vite@latest censusguard -- --template react`
- Copy all JSX files from Base44 `pages/` directory
- `npm install firebase`
- Create `src/firebase.js` with your Firebase config
- Global find-replace: from `'@/api/entities'` → from `'./firebase-entities'`
- Create `firebase-entities.js` wrapper using mapping above
- Replace Base44 `auth` (`useCurrentUser`) with Firebase Auth hooks
- Update routing to React Router v6

Phase 3: Data Migration (Week 3)

- Export all entities from Base44 (contact Base44 support or use API)
- Write migration script to import JSON → Firestore
- Validate all records transferred correctly
- Test dashboard with real data in Firestore

Phase 4: Deploy (Week 4)

- `firebase deploy --only hosting`
- Set up custom domain (`censusguard.ai` or `censusguard.com`)
- Set up Firebase Auth authorized domains
- Cancel Base44 subscription → saves \$100/mo

Phase 5: Vertex AI (Week 5-6)

- Deploy Vertex AI endpoint from existing model (89.6% AUC-ROC)
- Create Cloud Run function to call endpoint on patient data
- Wire to dashboard — replace mock scores with live Vertex predictions
- Test with synthetic patients before any real records

Dashboard Features — Full List

Feature	Description
Global Stats Bar	Total census, high/critical count, average risk score, 30-day retention rate
Patient Risk Monitor	All patients with name, unit, room, score, tier badge, velocity arrow. Click row → detail panel.
Patient Detail Panel	Full risk breakdown, top 3 drivers with % bars, score history sparkline, intervention log, action buttons.
Census Floor Tab	Visual floor map with color-coded rooms — risk at a glance.
Group Flow Tab	Unit cohesion score, group energy level, staff observation log.
Group Narrative Tab	AI-generated unit narrative summary, recent alerts in story form.
Active Alerts Panel	Real-time alert cards. Dismiss / Log Intervention / Escalate actions.
History Tab	Full ScoreHistory timeline. BHT events in cyan, admission intake in grey.
ROI Calculator	Bed count input, payer mix selector, cost vs. recovered revenue, bar chart, subscription toggle.

Design Tokens

```
--bg: #07070F
--magenta: #D4159A
--purple: #8844E8
--cyan: #10D8F0
--white: #FFFFFF
--light: #E0E0EE
--dimgray: #8888A8
--dark2: #111125
--cardline: #28284A
```

Key Contacts for Migration

Kourtney Rhodes (Founder): Kourtney@anchorpointhealthsystems.com · 405-887-0165

Vega (AI — Base44): <https://app.base44.com/superagent/69dabcfbdf2d23eb6ddb562>

Oryn (AI — Claude): Separate Claude instance — strategy & Wix coordination

GCP Project: censusguard-proof-of-concept · \$1,278.73 credits available

The code is React. The data is Firestore. The AI is Vertex. All three are yours.
